View Transparency

- What happens when views overlap and have transparency?

    As mentioned before, `subviews` list order determines who is in front

    Lower ones (earlier in the array) can "show through" transparent views on top of them

    Transparency is not cheap, by the way, so use it wisely

- Completely hiding a view without removing it from hierarchy

    `var hidden: Bool`

    A `hidden` view will draw nothing on screen and get no events either

    Not as uncommon as you might think to temporarily hide a view
